

Instance generator: $K \times g_{\max} \times \kappa$

48 configurations $\times$ 3
instances = 144 units

Arm A map the instance space

30 multi-starts $\cdot$ count distinct basins

*excluded and reported: non-finite,
non-converged, < 1% apart*

Arm B matched-
budget comparison

4 optimisers $\cdot$ 30 seeds
 $\cdot$ 20 000 evaluations

budget counted inside the objective

MEASURE

Cross the two arms

does position in the
map predict the verdict?

**Reconstruct 5 000
small studies**

4 configurations $\times$
5 seeds, resampled

*what a study of the usual
size would conclude*

ANALYSE
